## 4E: Integration by Substitution

Antidifferentiation is a useful tool for figuring out simple integrals, but we need a multi-tool that is more versatile for integrating more general functions.

So, let's remember the chain rule..

$$\frac{d}{dx} [F(g(x))] = F'(g(x))g'(x)$$

Using the definition of antiderivative, and letting  $F$  be the antiderivative of  $f$ , we get

$$\int f(g(x))g'(x) dx = F(g(x)) + C$$

So, the key is to let  $u = g(x)$  and  $du = g'(x)dx$

$$\int f(u)du = F(u) + C$$

The key is choosing the right  $u$  substitution, and this takes some practice.

$$\int f(g(x))g'(x) dx$$

Inside Function      Derivative of Inside Function

### Indefinite Integration with $u$ - substitution

Try it: Use  $u$ -substitution to integrate.  $\int (x^2 + 3)^3 (2x) dx$

- Define the  $u$  function
- Find  $du$
- Substitute and integrate
- Re-substitute for  $u$

Sometimes after defining  $u$ , it helps to write  $x$  in terms of  $u$ .

Example Find  $\int x\sqrt{2x-1} \, dx$

## Change of Variables for Definite Integrals

When using  $u$ -substitution on a definite integral, we must also apply this substitution to the bounds.

Example Evaluate

$$\int_0^1 x(x^2 + 1)^3 \, dx$$

- a) Define the  $u$  function
- b) Find  $du$
- c) Substitute for integrand and bounds and integrate

## A Couple Useful Theorems

Here is a useful theorem if the integrand is simply a product of a power of the function  $g(x)$  and its derivative  $g'(x)$ .

### THEOREM 4.14 THE GENERAL POWER RULE FOR INTEGRATION

If  $g$  is a differentiable function of  $x$ , then

$$\int [g(x)]^n g'(x) dx = \frac{[g(x)]^{n+1}}{n+1} + C, \quad n \neq -1.$$

Equivalently, if  $u = g(x)$ , then

$$\int u^n du = \frac{u^{n+1}}{n+1} + C, \quad n \neq -1.$$

Example Find  $\int \sin^5(x) \cos(x) dx$

### THEOREM 4.16 INTEGRATION OF EVEN AND ODD FUNCTIONS

Let  $f$  be integrable on the closed interval  $[-a, a]$ .

1. If  $f$  is an *even* function, then  $\int_{-a}^a f(x) dx = 2 \int_0^a f(x) dx$ .

2. If  $f$  is an *odd* function, then  $\int_{-a}^a f(x) dx = 0$ .

Remember:

- Even Functions:  $f(-x) = f(x)$
- Odd Functions:  $f(-x) = -f(x)$

Example Find the integrals

a)  $\int_{-\pi}^{\pi} \sin x$

b)  $\int_{-3}^3 (x^4 + x^2) dx$
